

URLShortener Technical Challenge

Would you be able to create a simple link/URL shortener service like

<https://bitly.com/>

or

<https://tinyurl.com/app>

that allows a user to upload a link and convert it into a shortened URL? At minimum, just a basic [ASP.NET](#) Core Web App form to submit a single link and get a result, but feel free to add more features to showcase your skills like bulk uploading a .csv of several links or the ability to preserve query parameters from the user when redirected.
